

Spin-on filter according to Hengst standard

Type 7 SL 30 ... 260; 7 SLS 90 ... 260

RE 51426

Edition: 2021-04 Replaces: -

Nominal sizes: 7 SL 30 ... 260; 7 SLS 90 ... 260 Nominal pressure 7 bar [101 psi] Connection up to G1 1/2, SAE 20

Features

Spin-on filters are used in mobile and industrial hydraulic systems for separating solid material from fluids and lubricating oils.

They distinguish themselves by the following:

- ► Filter for inline installation
- Optimized for mobile hydraulics, space-saving, service-friendly
- ➤ 7 SLS version with isolator valve, patented and environmentally-friendly
- ▶ Installation in suction, pressure or return lines possible
- ► Special, highly-efficient filter materials
- ► Filtration of ultra-fine particles and high dirt-holding capacity
- ► Optional version with maintenance indicator, pressure gauge or vacuum meter
- ▶ Optional bypass valve integrated in the filter housing

	Check valve in outlet (only with 7 SLS without bypass valve, not to be installed in suction lines)	R

- 1) The filter 7 SL(S) 180 contains two spin-on elements of size 90.
- ²⁾ The filter 7 SL(S) 260 contains two spin-on elements of size 130.
- 3) When using a pressure gauge, the maximum admissible operating pressure is reduced to 6 bar [87 psi].

Order example:

7 SL 45/21 P10-S00-00H1,5-R0M00

Further versions (filter materials, connections,...) are available on request.

¹⁾ Measured pressure differential across filter and measuring equipment in accordance with ISO 3968. The measured pressure differential at the maintenance indicator is lower.

Filter design

Easy selection of the filter size is made possible by the FilterSelect online tool. The filter can be designed using the operating pressure, flow and fluid system parameters. The required filter rating is based on the application, the sensitivity to contamination of the components and the environmental conditions.

The program leads you through the menu on a step-by-step basis.

A documentation of the filter selection can finally be created in the form of a PDF file. This file contains the entered parameters, the designed filter with material number including spare parts, and the pressure loss curves.

Function, section

General:

The spin-on filter is suited for direct installation in suction, pressure or return lines. It is installed upstream from components to be protected.

It consists primarily of a filter head (1), a threaded spin-on element (2) with built-in filter element (or two spin-on elements for sizes 180 and 260).

Optionally, a maintenance indicator (3) and a bypass valve (4) can also be configured for the filter.

The fluid passes through the inlet to the spin-on element (2), where it is cleaned. Any dirt particles that are filtered out collect in the filter element. The filtered fluid then enters the hydraulic circuit through the outlet. For sizes 180 and 260, fluid flows through both spin-on elements at the same time.

Spin-on filter with isolator valve 7 SLS:

The integrated check valve in the filter head prevents fluid from draining from the system while replacing the filter element (5) of the 7 SLS. During filter element change, the inlet side is blocked.

With the check valve (6) at the outlet - see supplementary information R - leakage is prevented from occurring on the clean side. (The filter is not suitable for installation in suction lines with this model.)

Maintenance indicator:

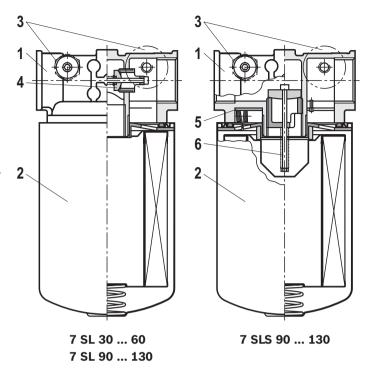

Special maintenance indicators are possible for the following applications:

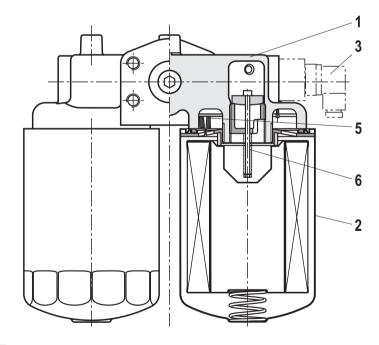

Suction line: Vacuum meter or vacuum switch Return line: Pressure gauge or pressure switch

Pressure line: Differential pressure switch

The location of the respective maintenance indicators is

depicted in the chapter on "Dimensions".

7 SLS 180 ... 260

Note:

If the maintenance indicator is ignored when a spin-on element change is required, there is the possibility the filter will go into bypass and contaminated oil will pass to the clean side of the filter outlet. Therefore the filtration effectiveness is no longer guaranteed. This means that some of the flow will enter unfiltered into the clean side of the filter. Effective filtration is no longer be guaranteed.

¹⁾ When using a pressure gauge, the maximum admissible operating pressure is reduced to 6 bar [87 psi].

Installation, commissioning, maintenance

Installation

- ► The max. operating pressure of the system cannot exceed the max. admissible operating pressure of the filter (see name plate).
- ▶ During assembly of the filter the flow direction (direction arrows) and the required servicing height of the spin-on element (see chapter "Dimensions") are to be considered.
- Cartridge replacement is made easiest when the spin-on element is oriented downward with the installation position.
- ► The maintenance indicator must be arranged so it is easily viewed in operation.
- ▶ Remove the plastic plugs from the filter inlet and outlet.
- ► The connection of the electrical maintenance indicator is via a mating connector that is attached to the maintenance indicator contacts and held by a screw or, in the cases of versions H, J, F and G, it is laid directly onto the contacts using a rubber bushing.

Commissioning

► Commission the system.

Mote:

The filter has no bleeding mechanism.

Maintenance

▶ If at operating temperature, the red indicator pin reaches out of the mechanical optical maintenance indicator or if the switching process in the electronic switching element is triggered, the spin-on element is dirty and needs to be replaced.

■ Note:

Sizes 180 and 260 have two spin-on elements, through which fluid flows at the same time and which need to be replaced during maintenance.

- ► The material number of the correct spin-on element is on the name plate of the filter assembly. Verify that it matches the material number on the spin-on element.
- ▶ Decommission the system.
- ▶ Release operating pressure on the system side.

Note:

The filter has no bleeding mechanism.

Unscrew the spin-on element.

Mote:

Sizes 180 and 260 have two spin-on elements, through which fluid flows at the same time and which need to be replaced during maintenance.

Screw on the new spin-on element hand-tight.

Please note:

If necessary, carefully tighten it in the depressurized state (use a band wrench if necessary)

- ► Commission the system.
- ► If filter loosens between the spin-on element and filter head after commissioning, the spin-on element will need to be tightened up.

WARNING!

- Only install or remove when system is not pressurized.
- ► Tank is pressurized!
- ▶ Only remove spin-on element when it is not pressurized.
- ▶ Do not replace maintenance indicator when filter is pressurized.
- Failure to observe flow of direction during assembly will cause filter element to be damaged beyond repair. Particles will enter the system and damage downstream components.

Important:

- ▶ Only trained specialists may work on the filter.
- Proper function and safety are only guaranteed if original Hengst spin-on elements and spare parts are used.
- Warranty becomes void if the delivered item is changed by the ordering party or third parties or improperly mounted, installed, maintained, repaired, used or exposed to environmental condition that do not comply with the installation conditions.

Directives and standardization

Product validation

Hengst filters, the filter elements built into them and filter accessories are tested and quality-monitored according to different ISO test standards:

Pressure pulse test	ISO 10771:2015-08
Filtration performance test (multipass test)	ISO 16889:2008-06
Δp (pressure loss) characteristic curves	ISO 3968:2001-12
Compatibility with hydraulic fluid	ISO 2943:1998-11
Collapse pressure test	ISO 2941:2009-04

The development, manufacture and assembly of Hengst industrial filters and Hengst filter elements is carried out within the framework of a certified quality management system in accordance with ISO 9001:2015.

Classification according to the Pressure Equipment Directive

The spin-on filters for hydraulic applications according to 51426 are pressure holding equipment according to article 1, section 2.1.4 of the Pressure Equipment Directive 97/23/EC (PED). However, under Article 1 Section 3.6 PED, hydraulic filters are exempt from the PED

if they are not classified higher than Category I (Guideline 1/19).

The fluids from the chapter "Compatibility with approved pressure fluids" were considered for the classification. They do not receive a CE mark.

Use in explosive areas according to Directive 94/9/EC (ATEX)

The spin-on filters without maintenance indicator or with a mechanical-optical maintenance indicator according to 51426 are not equipment or components in the sense of directive 94/9/EC and are not provided with a CE mark. The ignition risk analysis showed that these spin-on filters do not have their own ignition sources as per DIN EN 13463-1:2009.

Spin-on filters and the mechanical-optical maintenance indicators described here can be used in the following explosive areas:

	Zone suitability		
Gas	1	2	
Dust	21	22	

Complete filter with mech./opt. Maintenance indicator, pressure gauge, vacuum meter					
Use/assignment	Gas 2G	Dust 2D			
Assignment	Ex II 2G c IIC TX	Ex II 2D c IIC TX			
Medium conductivity pS/m min.	300				
Dust accumulation max.	-	0.5 mm			

A WARNING!

- ► Explosion hazard due to high temperature!

 Temperature is based on temperature of medium in hydraulic circuit and cannot exceed this value. Take steps to make sure max. admissible ignition temperature is not exceeded in explosive area.
- ► When using the spin-on filters according to 51426 in explosive areas, sufficient equipotential bonding has
- to be ensured. Grounding the filter with mounting screws is recommended. It has to be noted in this connection that paintings and oxidic protective layers are not electrically conductive.
- During spin-on filter replacement, the packaging material is to be removed from the replacement element outside the potentially explosive area.

If Important:

- ► Maintenance may only be performed by specialists on instruction of the owner in accordance with Directive 1999/92/EC Annex II Section 1.1.
- ► Functional and safety warranty is only applicable when using original Hengst spare parts
